

Assignment – 3

1. Create a user Alice and set password for Alice
2. Create a file named Course.txt and display its permission.
3. Display the file permission of Course.txt in numeric Format along with filename.
4. Create another user Bob and set password for it.
4. Change the file owner and group to Bob user.
5. Change the umask value to 027 from default and observe the changes.
6. Check the File permission, owner, group of file hello_world.txt using ACL.
7. Give user bob read permission for hello_world.txt without changing the original owner of the file and verify it.
8. Remove the above permission from the file using ACL and verify it.
9. Create directory named directory1 and check its permission.
10. Change the owner and group for the directory1 to Bob.
11. Alice owns a confidential file named confidential.txt. Bob needs read-only access to this file for reviewing it, but the administrator does not want to change the file's Owner or existing group permissions. Configure Bob's access using ACL and verify it.
12. Bob has completed his review of confidential.txt. Remove only Bob's ACL permission while keeping the original owner, group, and other permissions unchanged. Verify the configuration.
13. Alice owns a file named report.txt. Bob needs read and write access, while Charlie needs read- only access. The existing owner and group permissions must not be changed. Configure the required access using ACL and verify it.
14. Alice owns a directory named shared. Bob should be able to enter the directory and read its contents, but he must not be able to create, modify, or delete files. Configure Bob's access using ACL.
