

Assignment – 4

1. Attach a 20 GB hard disk to a virtual machine. Create 1 partition of 15 GB and second partition of 5 GB. Format the first partition with EXT4 file system. Format the second partition with EXT3 file system.

Mount the first partition under the /mnt/data directory. Mount the second partition under the /database directory. Add entry in the fstab file for the partitions so that after restart the partitions are automatically mounted.

Unmount the above partitions. Remove the fstab entry for the 2 partitions. Delete the partitions on the 20 GB hard disk. Shutdown the virtual machine.

2. Attach additional 2 20 GB hard disks to the virtual machine. Start the virtual machine. Create a volume group by name ditiss by adding 2 20 GB hard disk into it so it will be of 40GB. In this volume group create 2 Logical volumes. First logical volume will be of size 10 GB. The other logical volume will be of 15GB size. Format both the logical volumes with ext4 file system. Mount the first logical volume under the /mnt/linux directory. Mount the second logical volume under /mnt/win folder.

Now add the remaining third 20 GB hard disk to the volume group ditiss to increase its size from 40GB to 60GB. Also increase the first logical volume size from 10GB to 25GB.
